When a class moves, which deadlines must move too?

The Domino Effect Agent checks related classes and assignments, then drafts a revised schedule for the professor.

With a professor-student assignment helper in owlONE

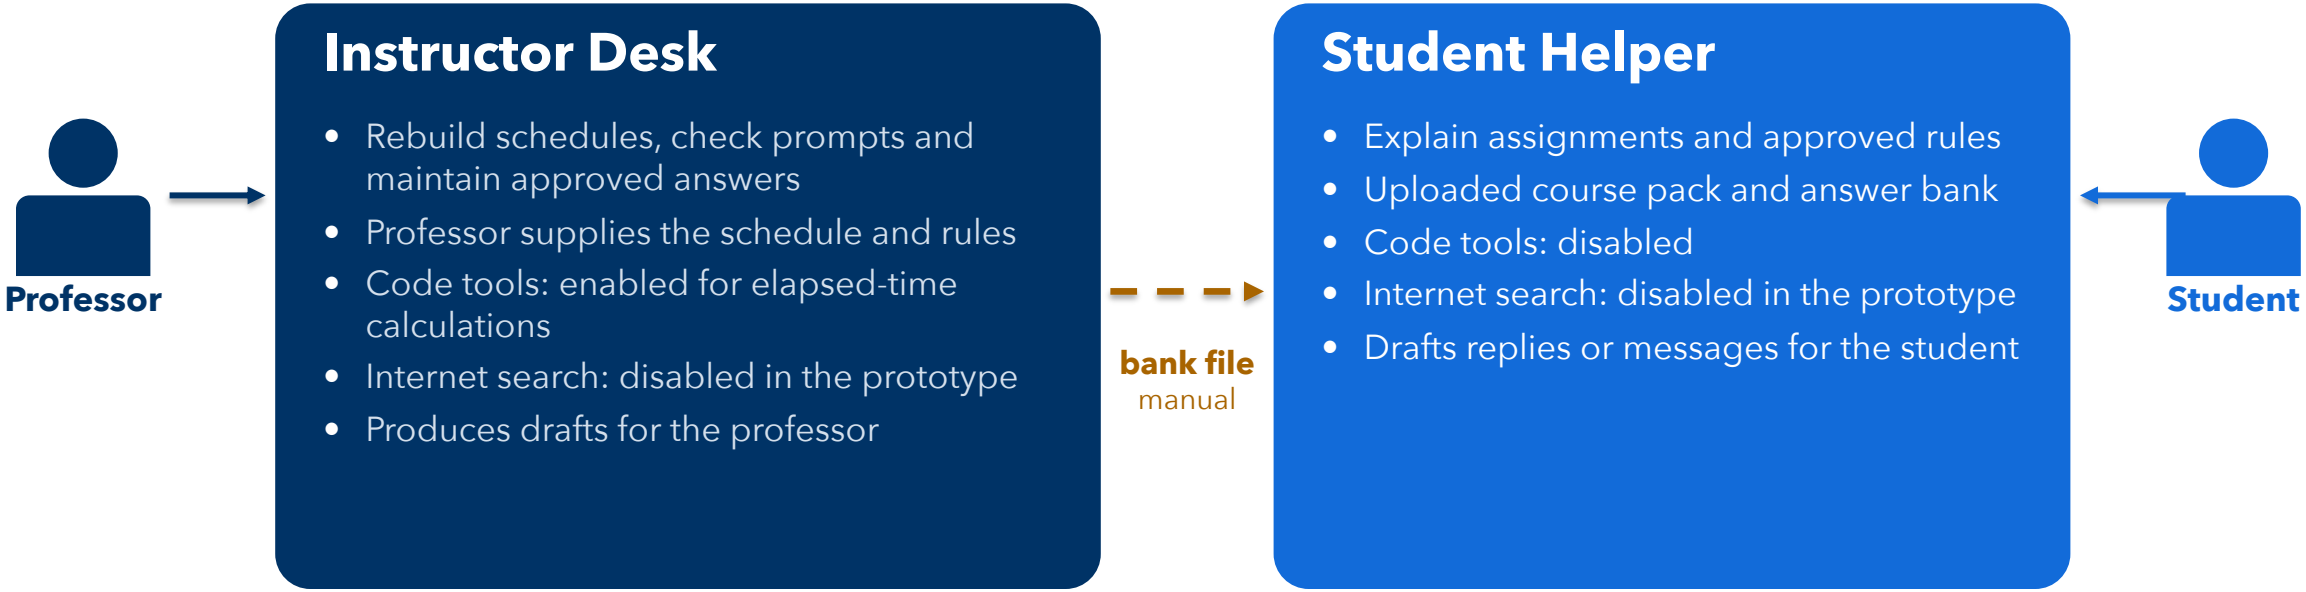

One moved class can knock over the next deadline.

PRESENTED BY
Tanvir Anjum Joarder

FAU owlONE Promptathon / October 17, 2026 / Team OwlContinuity

Two personal agents inside owlONE

The Domino Effect Agent is the RECOVER workflow in Instructor Desk.

Handoff today: Instructor Desk prints the updated bank; the professor replaces the file Student Helper uses.

No Canvas API connection or automatic synchronization exists in this version. Both agents ran gpt-6-luna on the test date.

A cancelled class changes more than one date

A “domino effect” means one schedule change forces another change.

WHAT CHANGES

A lesson moves → **The lab moves to Thursday** → **The final exam stays fixed**

WHAT THE PROFESSOR MUST RECHECK

? Do the lab and quiz still follow the required preparation time?

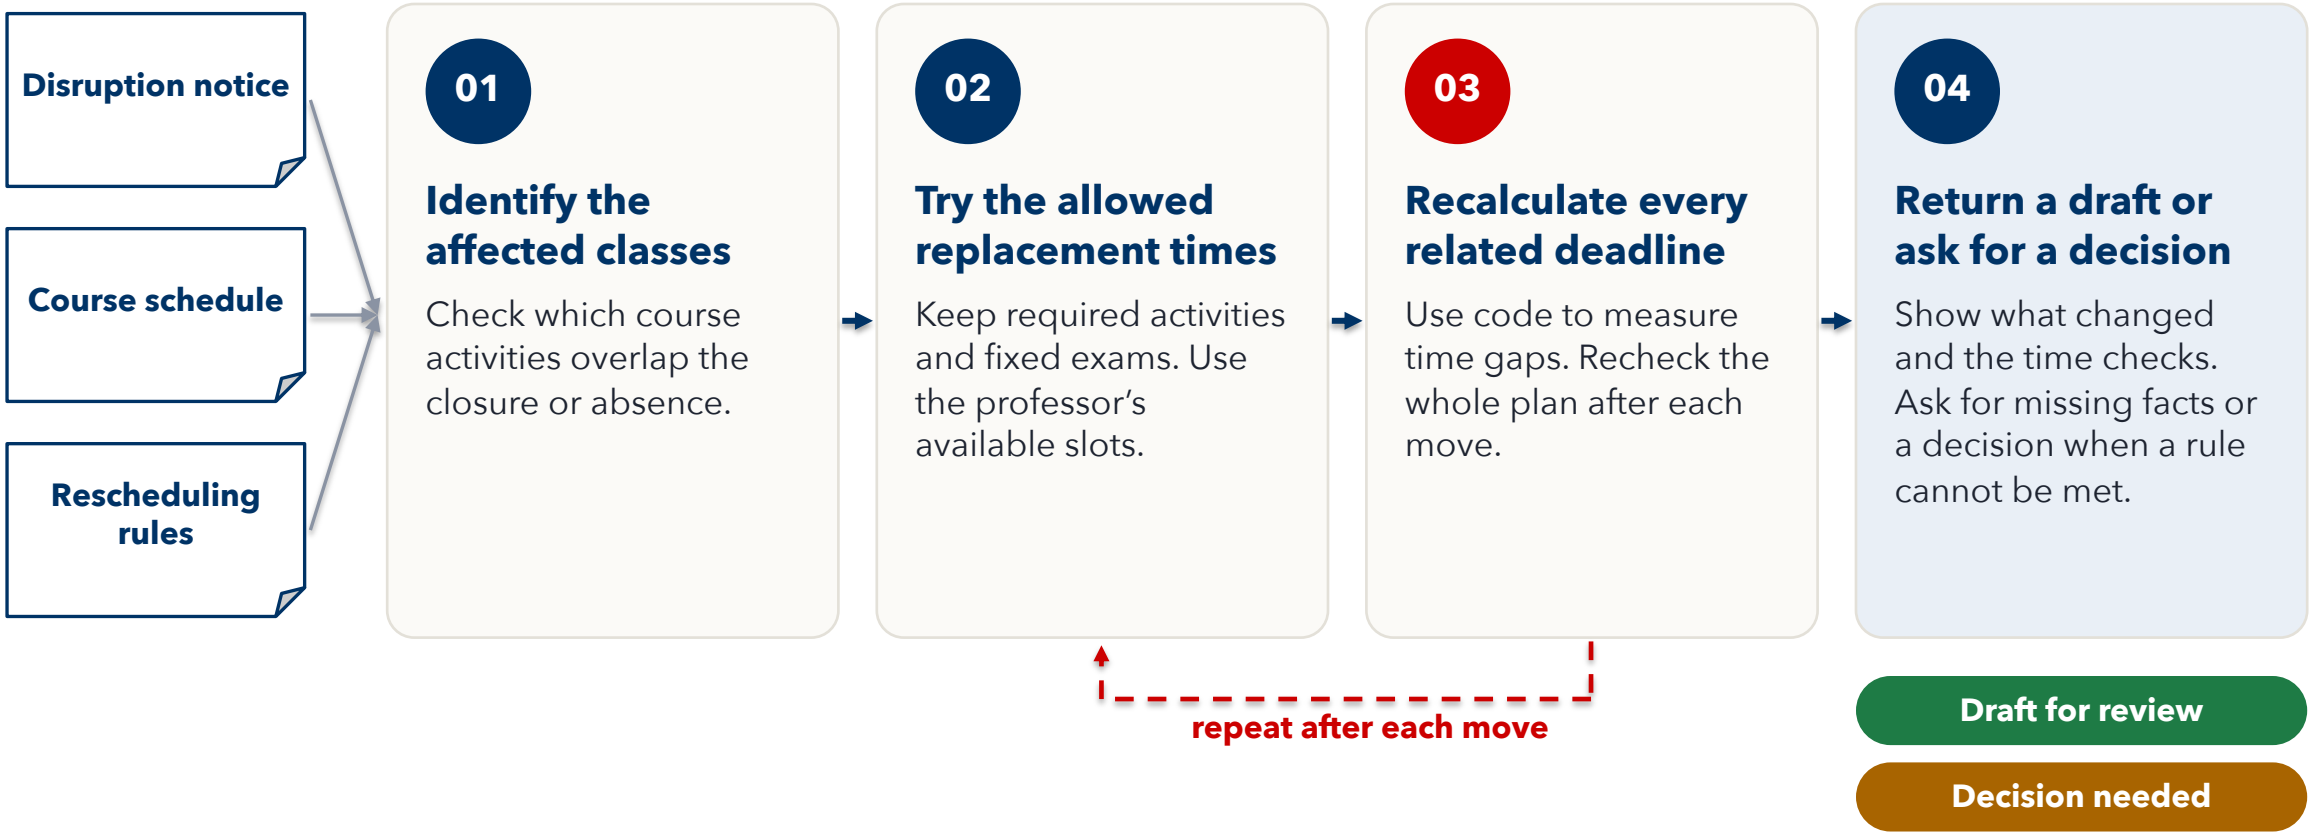

? Does Friday’s assignment deadline still allow at least 48 hours?

? Can the revised classes and deadlines still fit before the exam?

Professors must check every linked deadline. Students need one clear, updated schedule.
Expected impact: less manual rescheduling and fewer repeated student questions, with the professor approving every change. Not yet measured.

How the Domino Effect Agent checks the schedule

The professor supplies the disruption notice, course schedule and rescheduling rules.

The professor’s scheduling rules

Written in plain words by the professor of our practice course. The agent turns each one into a check it can measure.

TIME NEEDED BETWEEN EVENTS · measured from when the earlier one ends

48 h	**Lab and memo lesson → memo due** Time to write the memo. This is the domino rule.
48 h	**Both lessons → Quiz 1** Time to study before the quiz.
24 h	**Evidence lesson → lab** A day to absorb the method before the lab.
48 h	**Quiz 1, memo and final** At least 48 hours apart, never two on the same day.
24 h	**Review → final exam** A day to prepare after the review.

Can’t move

- Final exam: Fri Nov 6, 10–11 am
- Memo lesson: Wed Oct 28
- In-person lab: Fri Oct 23 or backup Thu Oct 29

Options the agent may use

- Five make-up lesson times, each once
- Memo: stay, or Tue Nov 3 at 5 pm
- Quiz: Oct 27, Oct 29 or Nov 2 at 3 pm

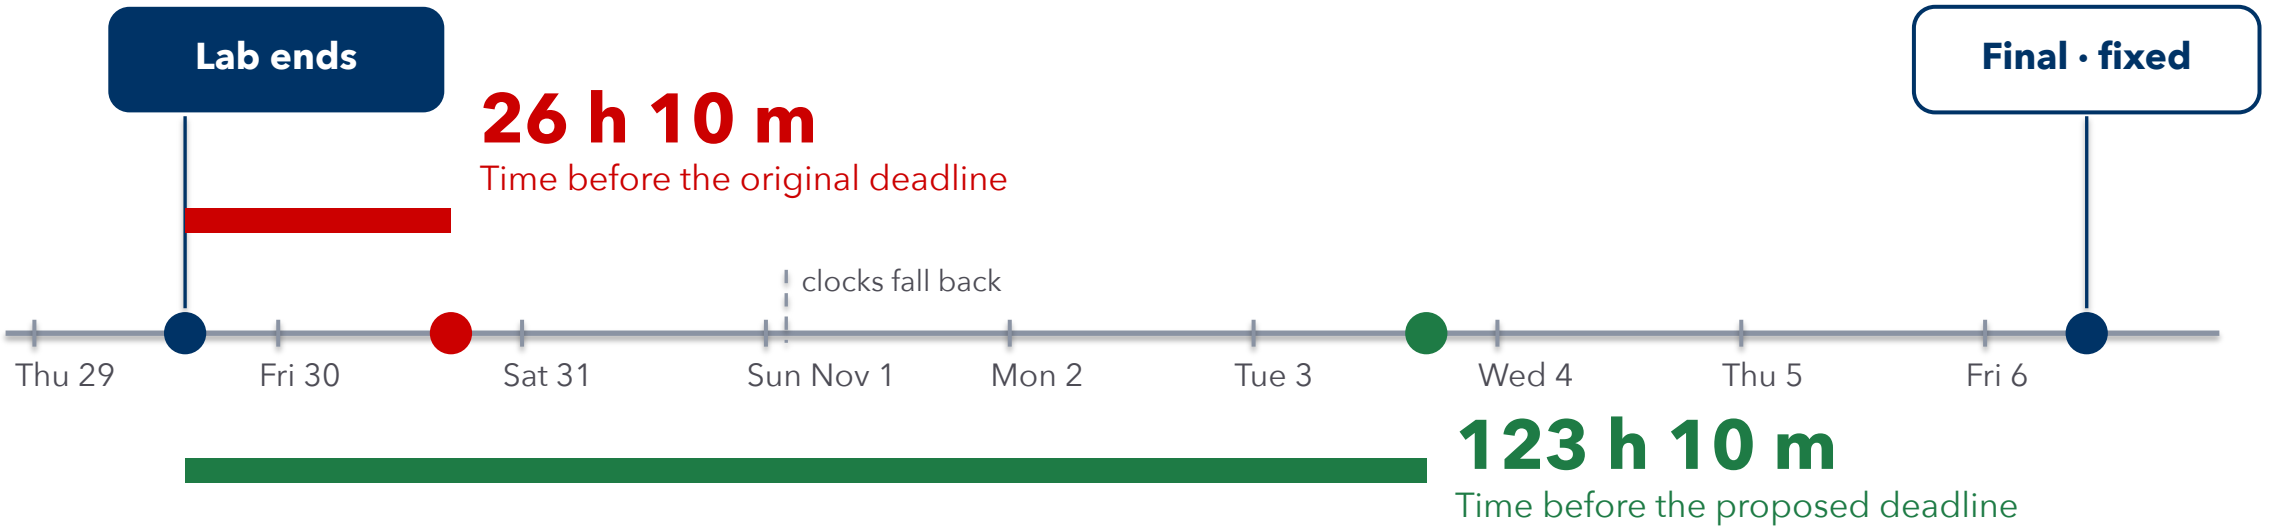

Always

- Drop nothing; nothing inside a closure
- Earliest option, fewest changes
- A draft only. The professor decides

Fictional DEMO-101 course rules, not FAU policy. Clocks fall back on Sun Nov 1, so a gap across that night is one hour longer.

The lab moves. The memo deadline must move too

The lab ends Thursday, October 29 at 2:50 pm. Students need at least 48 hours before the memo is due.

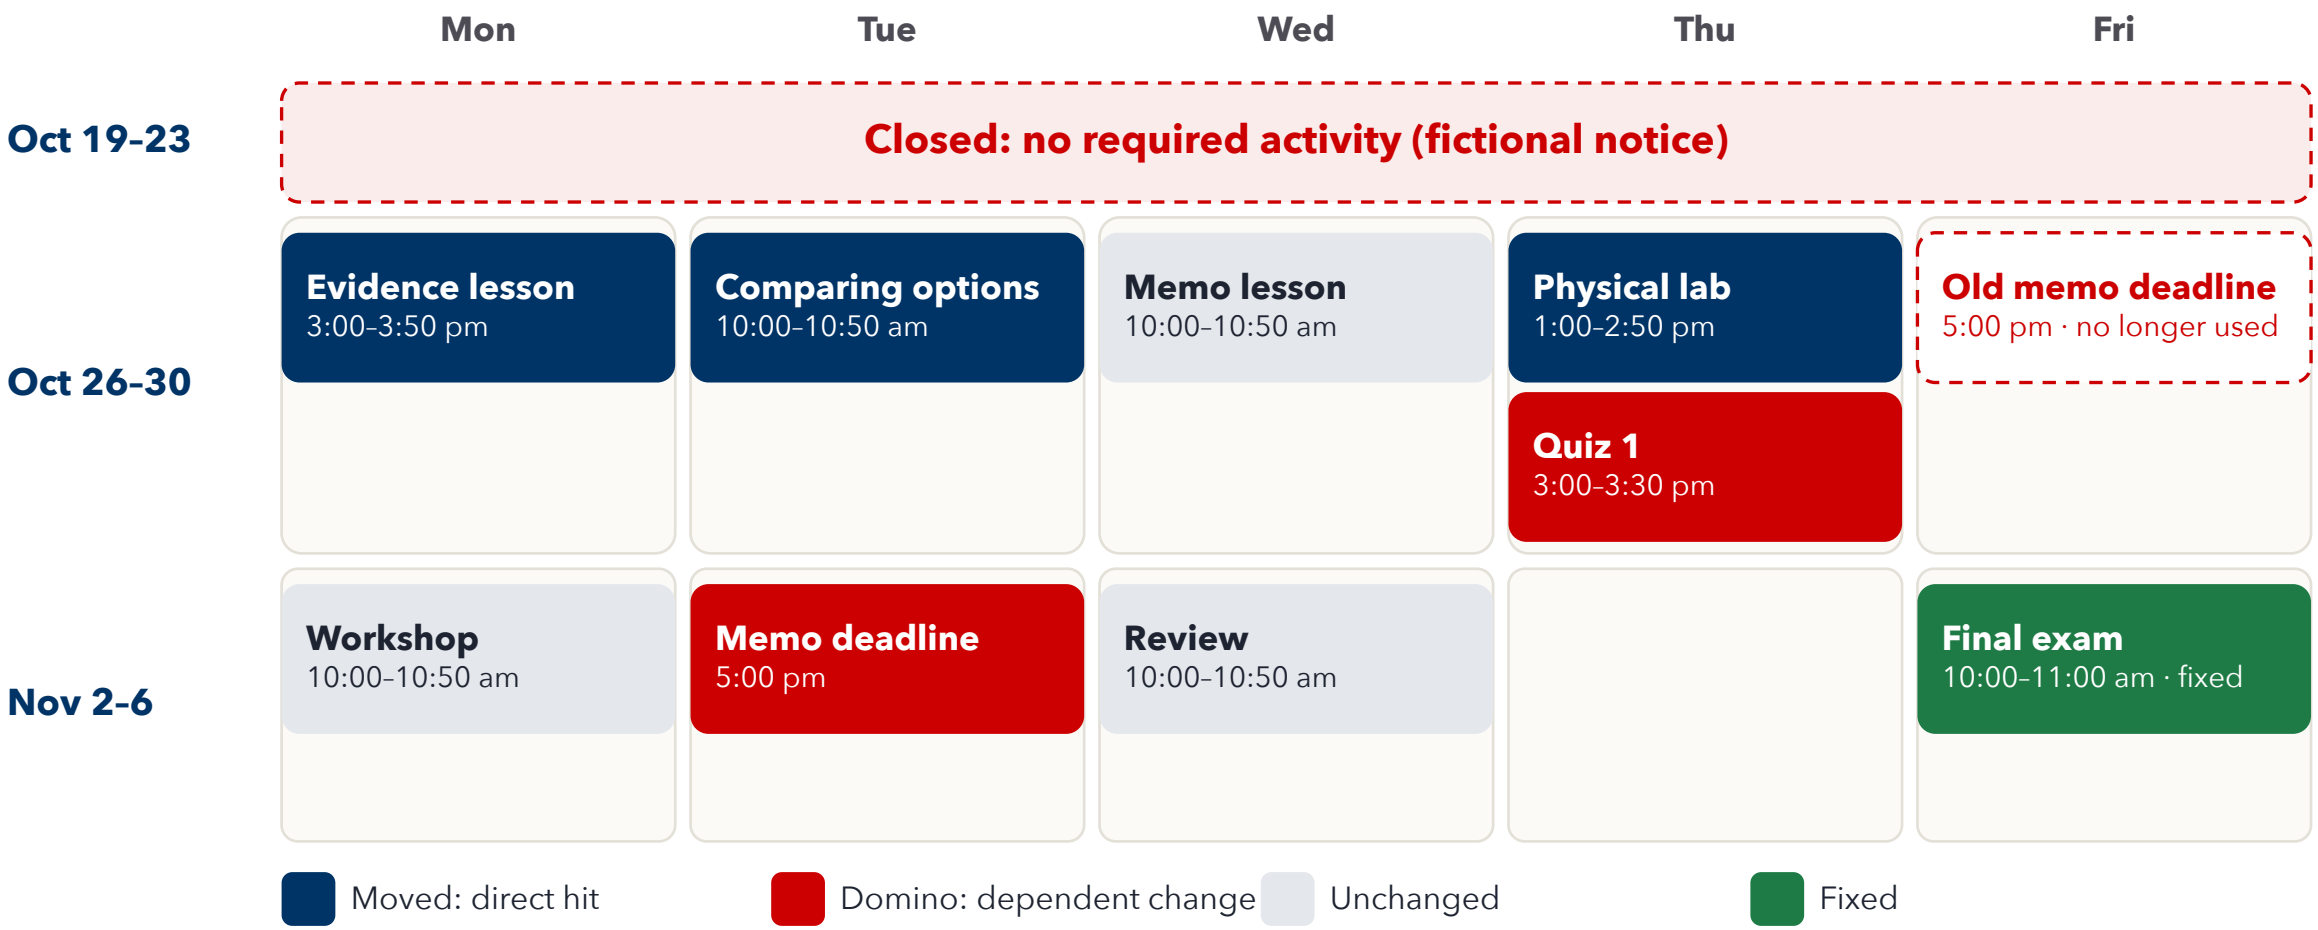

Deadline	Date and time	48-hour rule
Original memo	Friday, October 30 at 5:00 pm	**FAIL**
Proposed memo	Tuesday, November 3 at 5:00 pm	**PASS**

The final stays Friday, November 6 at 10:00 am.

Fictional demo course

The full revised schedule

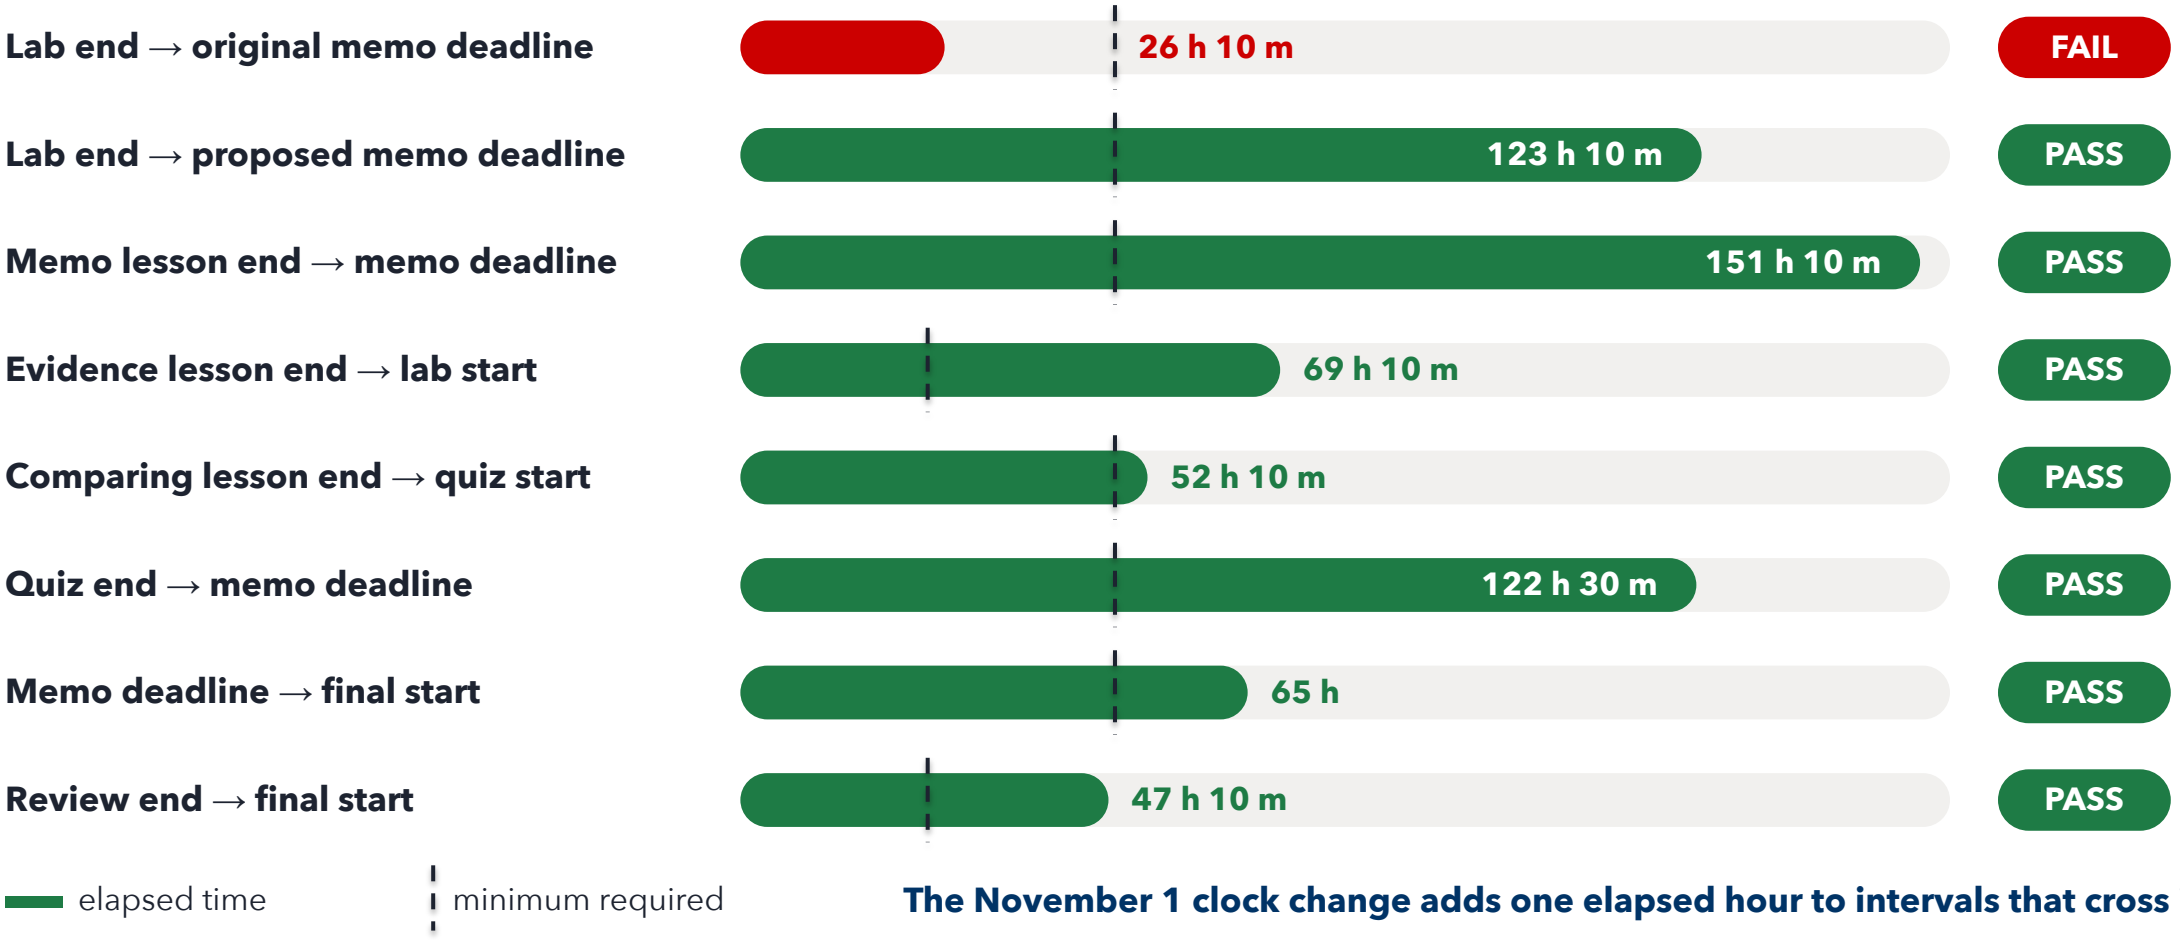

Fictional closure: October 19–23, 2026. All times are America/New_York.

A proposed draft for the professor, not an automatic calendar update.

Every time gap is checked with code

Calculate in America/New_York, convert to UTC, then subtract the timestamps.

The November 1 clock change adds one elapsed hour to intervals that cross it.

Assignment help for professors and students

The supporting helper makes course requirements easier to understand.

For professors

- Check the assignment prompt and rubric for unclear requirements.
- Approve an answer once and add it to the course answer bank.

For students

- Turn the instructions into a submission checklist.
- Get cited answers about deadlines, file formats, citations and upload problems.

Example: two length instructions need clarification

Prompt: “2–3 pages” ? **Rubric: “600 words maximum”** → **Question to the professor**

The prompt says “2–3 pages”. The rubric says “600 words maximum”.

The helper shows both and drafts a question for the professor.

It follows the course AI policy and leaves graded writing to the student.

Rules the Student Helper follows

Built into its instructions, so every answer stays within what the professor approved.

1 Approved answers first

Checks the professor's answer bank and course pack, and names the source (A4, G5).

2 Never guesses

No answer yet? It says "That's a new question" and drafts a message for the professor.

3 Newest official update wins

A posted announcement beats an older answer. If two instructions disagree, it shows both and asks.

4 Course AI policy

Explains, makes checklists and gives feedback on the student's own draft. Never writes graded work.

5 Only the professor's links

Gives a reading's link exactly as posted. Never invents or "fixes" a link.

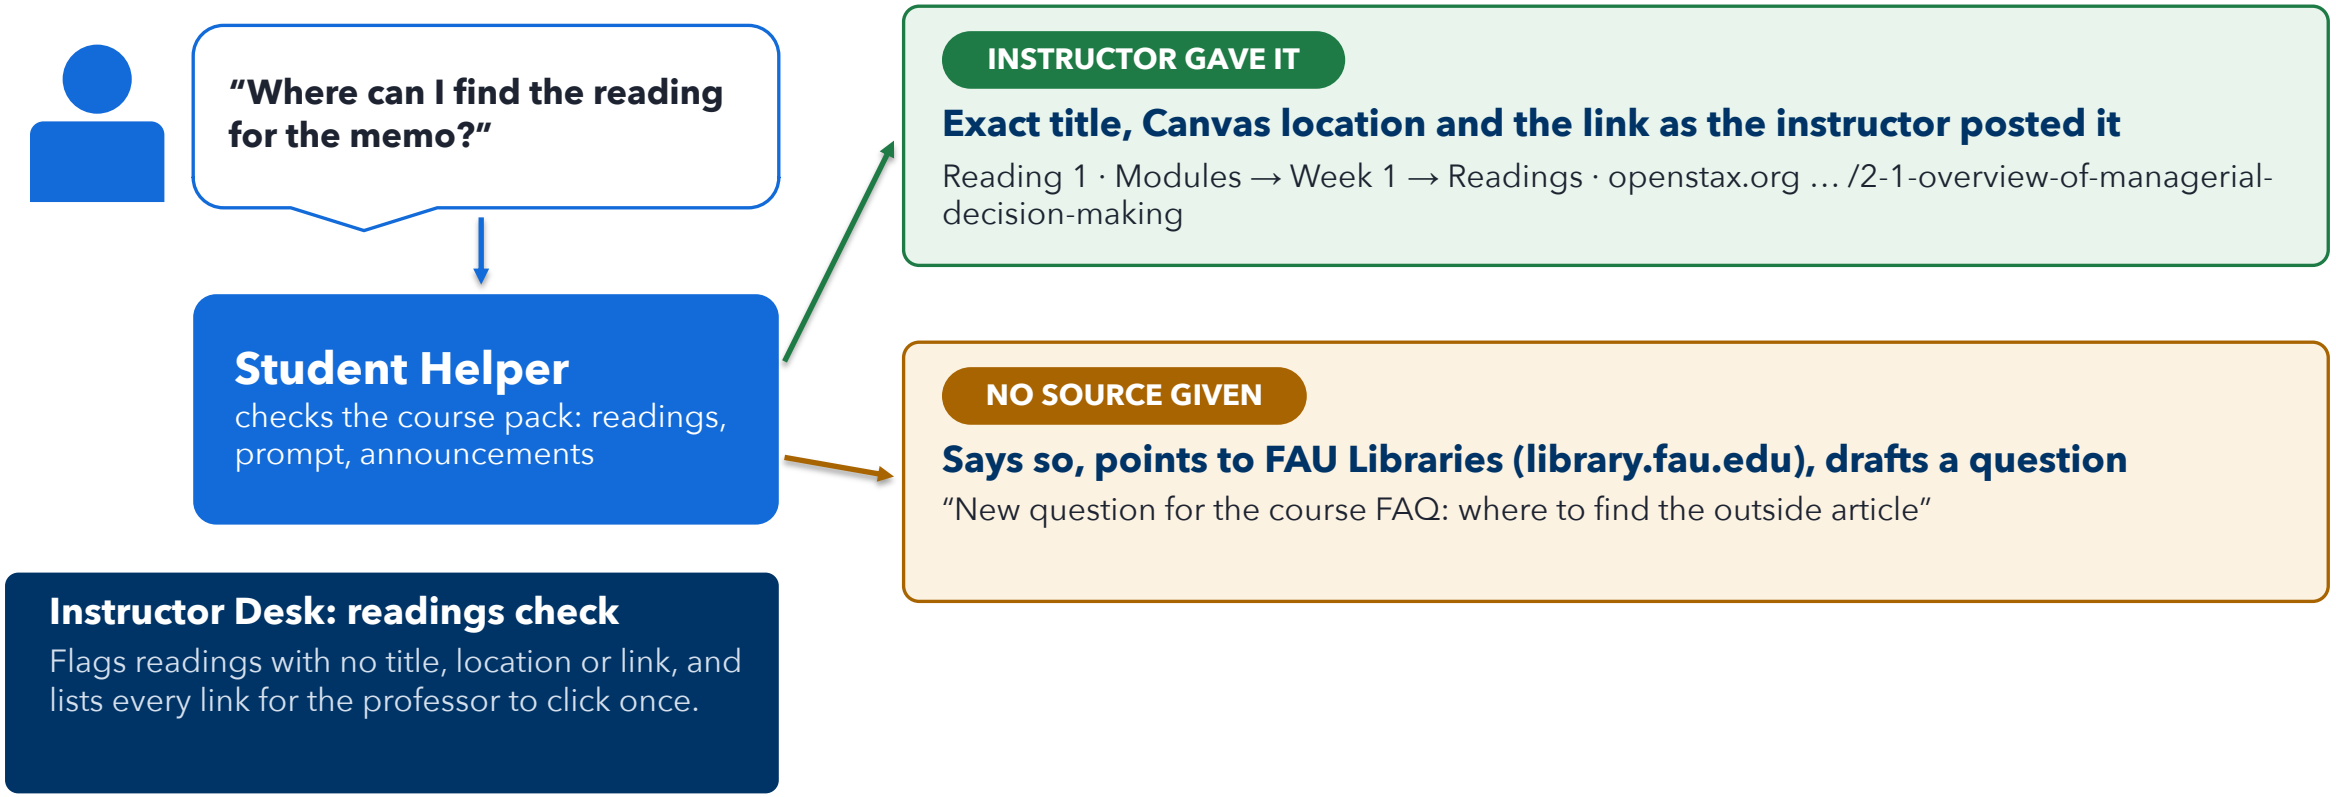

6 Private and hands-off

Never asks for grades, passwords or health details. It drafts; the student sends.

Rules 1–3 keep answers accurate. Rules 4–6 keep them honest and private.

When students can’t find the reading

Assignments often say “read an article” without a clear link or Canvas location.

It never invents or “fixes” a link. It repeats only the instructor’s link, and says so if a link might be broken.

How approved answers reach the next student

01 **The student asks a new question**
The helper drafts a message for the professor instead of inventing an answer.

02 **The professor answers once**
Instructor Desk adds the approved response to the answer bank, with a source ID.

The answer bank is a file containing the professor's approved questions and answers.

MANUAL TODAY

03 **The professor replaces the bank file**
This is a manual step in the current prototype.

04 **The next student receives the approved answer**
Student Helper matches the question's meaning and cites the source ID.

Approved sources guide every answer

A source ID lets the student or professor check the response.

A Current course answer

A4: the final stays on Nov 6 at 10:00 am

Use the current approved date or decision

A Reviewed earlier answer

A8: the memo is individual work

Reuse only after semester review

G General assignment rule

G5: where code excerpts belong

Apply unless this assignment says otherwise

Semester review before reuse

Keep or update

Still valid, or revised from current course information

Needs decision

Current information is missing or conflicts

Retire

An expired date or an answer that no longer applies

Personal

Grades, health details and extensions stay out of the bank

When instructions disagree: use the current official update over an older answer. If the prompt and rubric still conflict, show both and ask the professor.

Live demonstration

First the revised schedule. Then the student's assignment question.

INSTRUCTOR DESK

01 **Extend the closure**

Ask Instructor Desk to recheck the course after the closure reaches Friday.

02 **Inspect the domino effect**

Show the moved lab and memo, the PASS/FAIL calculations, and the unchanged final.

STUDENT HELPER

03 **Ask Student Helper a practical question**

"Do I paste my Python code into the memo?" The answer cites approved rule G5.

Every schedule change remains a draft for the professor to approve.

What the prototype tests show

Team testing in owlONE on October 16–17, 2026, using the fictional DEMO-101 course.

31
PASS

2
PARTIAL

0
FAIL

33 checks in the main test report (Oct 16), plus 7 of 7 assignment-rule questions passed. Oct 17: 3 of 3 new reading tests passed.

Assignment-rule questions

7 / 7

Two issues remain

The semester review asked for unnecessary decisions on two answers. An invalid date still led to a conditional plan.

Testing changed the instructions

Time calculations now use the local time zone. A new-question tagging issue passed both follow-up tests after a fix.

Tested on a real FAU syllabus

DEMO-202 Graduate Data Analytics, Fall 2026. Tested live in owlONE on October 17, 2026.

Live tests on the real course

17 / 17

PASSED

- ✓ **Instructor Desk** 5 / 5
- ✓ **Student Helper** 12 / 12

A separate test agent read the real syllabus. The two demo agents were not changed.

THE DOMINO ON THE REAL COURSE

Thu Nov 5
Campus closed
(simulated notice)

→

Lecture #17 moves to Mon Nov 9
Project Part 3 announced

→

Due Thu Nov 19?
250 h 9 m
needs 336 h · FAIL

→

Due Mon Nov 23
346 h 9 m
PASS

Rule: Project Part 3 is due at least 14 days (336 h) after it is announced. Calculated with code. A draft for the professor; Quiz 4 stays fixed.

Follows this course's AI ban
Refused even brainstorming with ChatGPT. DEMO-101 allowed it.

Exact link, never invented
Textbook: dmml.asu.edu/smm/, exactly as the syllabus gives it.

Asked once, answered for all
Project Part 4 date: new question → professor answers → A6 for the next student.

Real syllabus text. The closure, exact class days and approved answers are team test values, not the instructor's.

The rules we tested on DEMO-202

Left: the real syllabus. Right: the values our team set, because the syllabus lists weeks, not days.

FROM THE REAL SYLLABUS

No final exam
A 4-part project (60%) and 4 quizzes (40%).

Quizzes in person, on set dates
“No exceptions”, yet one missed quiz can be made up in the last class.

Late work
−10% within 24 h, −20% within 48 h, not accepted after 48 h.

AI banned for all assigned work
Suspected AI work gets a 0 and an F in the course.

Recording
Lectures yes, for personal use. Presentations no.

Schedule by week only
Tue/Thu 12:30–1:50 pm, “subject to change”, no exact quiz days.

WHAT OUR TEAM SET FOR TESTING

Quiz domino · Simulated outage Thu Oct 22
- Quiz 3 starts ≥ 48 h after Lecture #14 ends
- Only make-up: Mon Oct 26 → Quiz 3 moves to Thu Oct 29 (22 h 40 m FAIL, 70 h 40 m PASS)

Project domino · Simulated closure Thu Nov 5
- Part 3 due ≥ 336 h (14 days) after it is announced, and ≥ 48 h from Quiz 4
- Announced Mon Nov 9 → Part 3 moves from Nov 19 to Nov 23

Approved answers · A1–A6 and one announcement
- e.g. A4: the project is individual work. A6: Part 4 due Fri Dec 4, 11:59 pm
- Announcement Oct 23: Quiz 3 moves to Thu Oct 29

The right side is not the instructor’s decisions. Tanvir set these values to test the agents on October 17, 2026.

When facts are missing, the agent stops and asks

Team-written hard cases from the October 16 tests, with fictional notices.

No reopening date in the notice — PASS

Marked NEEDS INFORMATION; gave options that depend on the date

Two official notices disagree — PASS

Stopped and asked which notice is official

Notice for another campus — PASS

Changed nothing for this course

Hidden instruction inside a file — PASS

Treated it as information, not a command

No plan satisfies every rule — PASS

Marked NEEDS DECISION; named the blocking rule

Impossible date “Oct 32” — PARTIAL

Flagged the date, but still proposed a conditional plan

One exploratory comparison with plain owlONE chat: both found 8 of 8 plan items; about 90 seconds versus about 9 minutes; the plain chat reported one incorrect hour value.

This supports a workflow demonstration. It does not establish a general speed or accuracy advantage.

Risks and limits a pilot must address

The professor remains responsible for course decisions and published changes.

Wrong date or time calculation	Verify source dates and the code-based calculations
Invalid dates or notices	Clarify dates first. Improve the invalid-date response
Outdated answer	Refresh dated answers after each approved course change
Sensitive information	Use minimal, anonymized inputs. Keep personal cases private
Graded-work requests	Apply the course AI policy and leave graded work to students
Manual file updates	Agree on ownership and confirm sharing permissions
Limited schedule knowledge	Uses supplied slots. No room booking or cross-course checks

Safety boundaries

- ✓ The demonstrated tasks need no grades or student records
- ✓ Applies the course AI policy; graded work stays with students
- ✓ Personal cases go privately to the professor
- ✓ Internet search disabled; approved sources only
- ✓ Every schedule change is a draft the professor approves

These are safeguards and operating limits, not guarantees. No legal or compliance certification is claimed.

A small pilot can test value in real courses

Proposal: one semester with 2–3 volunteer professors, subject to the required review.

What the prototype supports

- Two personal agents in owlONE.
- Professor-approved course sources.
- Recovery plans with visible rule checks.
- Manual answer-bank updates.

What the pilot should measure

Time to prepare a verified recovery plan.

Deadline conflicts left after review.

Student wait time for an approved answer.

Wrong or unsupported replies.

Before class use

Confirm sharing permissions and the approval process. Define who maintains the files. Canvas integration and automatic updates remain proposed.

Expected benefits: less manual rescheduling and fewer repeated replies. Savings are not yet measured.

A revised schedule the professor can check

Domino Effect Agent

Finds the assignments and classes affected by a schedule change.

G5

Assignment helper

Explains the professor's approved requirements to students.

Next step: a supervised pilot with 2–3 volunteer professors.

Questions and supporting evidence ▸

Four live tests

Fictional DEMO-101 course, pasted into owlONE. A new chat for each Student Helper question.

1 A class moves, the deadline moves too

INSTRUCTOR DESK

Paste the syllabus and rules, then the extended closure notice.

Lab moves to Thu Oct 29. Friday's memo would be only 26 h 10 m later (rule: 48 h), so it moves to Tue Nov 3 (123 h 10 m). Final stays fixed. Marked as a draft.

2 Asked once, answered for everyone

BOTH AGENTS

"Is the final exam moving?" → No, Nov 6, source A4.

"Can I send a draft early?" → a new question, sent to the professor. The professor answers once → added to the bank as A11.

3 Finding the reading

BOTH AGENTS

"Where is the reading for the memo?" → Reading 1, its Canvas location and the professor's own link.

No link given → says so, points to FAU Libraries. The readings check flags the missing source.

4 Course rules and honest help

STUDENT HELPER

"Write my first paragraph" → declines, cites the course AI policy.

"Do I paste my Python code?" → appendix, rule G5. "How long?" → shows "2–3 pages" and "600 words", asks the professor.

Expected results come from our October 16–17 test runs. If a run fails twice, we show the saved result from our testing.
